

OOS Impact Analytics — User Guide

A quick guide for the marketing team. No technical knowledge needed.

What this dashboard is for

It answers one question: **how much revenue and margin are we losing because products aren't available on Amazon — and which products are worst?** Every day it compares what each product *actually* sold against what it *would* have sold if it had been in stock, and turns the gap into euros. Use it to spot which SKUs to prioritise for restocking, which listings need attention, and how much a stock-out really cost.

One rule to remember: the headline number is **Lost CM3** — the contribution margin (real profit) we gave up. **Lost revenue** is the top-line version of the same thing.

Getting in

Open the dashboard link and enter the shared password. That's it — the data refreshes automatically, so you always see the latest.

The filter bar (top of the page)

Five controls sit across the top. Set these first; everything below updates instantly.

Filter	What it does
Region	EU (all European marketplaces, pooled), GB (UK / amazon.co.uk), or EU + UK (combined) for the total. EU and UK stock are separate warehouses, so they're tracked apart by default.
Period	Full range, or drill into a Year / Quarter / Month / Week. You can pick more than one (e.g. two months).
Min demand	How busy a product must be before a no-sales day counts as a stock-out. Leave at the default (3/day) unless investigating slow movers.
Search	Type part of a product name or SKU to focus on one product or a range.

There's also a **thresholds** expander. You can ignore it — the defaults are set with Ops. Open it only to tune sensitivity (e.g. how tight stock must be to count as “critically low”).

The headline (under the filters)

- A **chart** of lost revenue, lost CM3, and how many SKUs were out of stock, over time.
- **Lost** — sales we *couldn't* make because we were out of stock (the real problem).
- **Miss** (Cooling down) — sales we *chose* to give up by easing off (raising price / cutting ads) to stretch tight stock. Voluntary, so kept separate.
- **Ramp-up** (Heating up) — the cost of getting a product going again after it came back.
- **Listing blocked** — products on healthy stock but **not selling at all**: the listing may be suppressed. Shown as “unrealized” and **not** counted as a stock-out. **Check these listings.**
- **OOS rate** — share of time out of stock. **WISR** — in-stock rate weighted by how important each product is (higher is better).

The tabs — where to look for what

Tab	Use it to...
Most affected SKUs	See the ranked list of biggest losses. Click a SKU for its stock & sales timeline. Start here.
Stock-out calendar	A month-by-month heatmap — spot seasonal or recurring patterns.
Stock-out events	Every stock-out as a row (start, end, duration, cause, € lost). Download as CSV.
Cooling down	Products we deliberately throttled to protect tight stock — and the cost.

Tab	Use it to...
Heating up	Products recovering after coming back — extra ad spend + sales still ramping.
Country overview	Which countries carry the loss, valued at each country's own price and margin. Drill into one country.
Top sellers	A watchlist of the highest-value products and their current stock status.

Most tables have a **download button** for exporting to Excel / CSV.

Reading a “cause” label

- **Physical (network)** — genuinely zero stock in the warehouse.
- **Critically low (reach)** — almost out; days of stock left below the safe threshold.
- **Demand gap** — in stock on paper but selling nothing when it should be — usually a real availability problem.
- **Suppressed sales (post-OOS)** — still recovering after a stock-out.
- **Cooling down** — we eased off on purpose (not a problem).
- **Listing blocked (in stock)** — plenty of stock, zero sales → **a listing issue to investigate**, not a stock-out.
- **Heating up** — being pushed back to full speed after returning.

A typical workflow

- 1 Pick your **Region** and **Period** (e.g. EU, last quarter).
- 2 Look at the **headline KPIs** — how much did we lose, and is the trend up or down?
- 3 Open **Most affected SKUs** and note the top few by Lost CM3.
- 4 Click one to see *when* and *why* it went out — real stock-out, deliberate throttle, or blocked listing?
- 5 Check the **Listing blocked** list — quick wins (a listing fix, no restock).
- 6 Export **Stock-out events** or the ranked table to share with Ops / Supply Chain.

Good to know

- **Numbers are estimates, not the accounting P&L.** They measure lost *opportunity* from Amazon's own stock and sales data, so they won't tie to the cent with finance. For prioritising, not for booking.
- **EU vs UK are separate warehouses** — that's why they're split. Use **combined** for the total, but restocking decisions are per-region.
- **The newest day is always one day behind** — today's data is partial, so it's excluded until complete.
- Everything is in **euros, whole numbers, European formatting** (1.234,5), with **English product names**.

Questions or a metric that looks off? Flag it — the model's thresholds are all tunable and documented in the methodology sheet.
